HEALTHY COW CALCIUM GRAMS / HEAD / DAY	-60	-21	21	40	60	90	110	120	305	
	NIL		250-300		200-250			50-100		50-100
WHY	Stimulate calcium metabolism in the cow by limiting supplemental calcium inclusion		<ul style="list-style-type: none"> ■ Decreases risk of milk fever and downer cows ■ Stimulates appetite post-calving ■ Optimises body condition post-calving ■ Drives peak milk production sooner and higher ■ Bolsters immune function ■ Improves reproductive performance ■ Balances low calcium supplements such as whole crop silage and PKE 				<ul style="list-style-type: none"> ■ If a cow does not have enough dietary calcium, she will pull calcium from her bones and/or reduce milk production ■ Replenish calcium stores drained through calving and peak lactation ■ To mitigate autumn milk fever ■ Promotes hoof hardness to help mitigate lameness ■ Bolster immune function to help minimise mastitis risk
